Functionland - Team

Keyvan M. Sadeghi

9 years in executive tech positions
Open-source veteran

MSc. Artificial Intelligence,
University of Southampton

Ehsan Shariati

Former Software Lead at L'Oreal
User Experience specialist

MSc. Electrical and Computer Eng.,
University of Colorado Boulder

Ehsan Emami

Sr. Development Engineer at Amazon
Hardware specialist

MSc. Electrical and Computer Eng.,
University of Waterloo

Status quo

Google's mission:

“ Organize the world's information
and make it universally accessible
and useful.

Both noble and humble.

Let's put it to a test, shall we?

Something easy, review of a website on YouTube.

Status quo

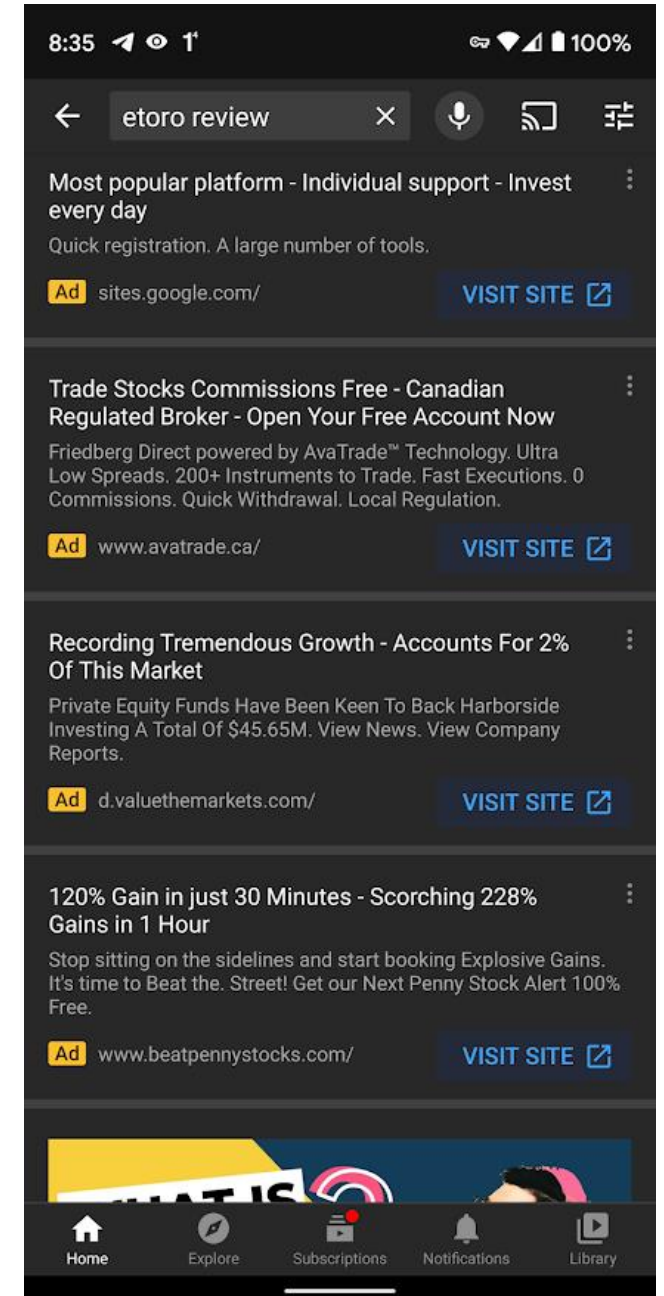

Google's mission:

“ Organize the world's information
and make it universally accessible
and useful.

Both noble and humble.

Let's put it to a test, shall we?

Something easy, review of a website on YouTube.

Status quo

No information whatsoever on the first page.

Just Ads!

What happened? Where's my accessible and useful?

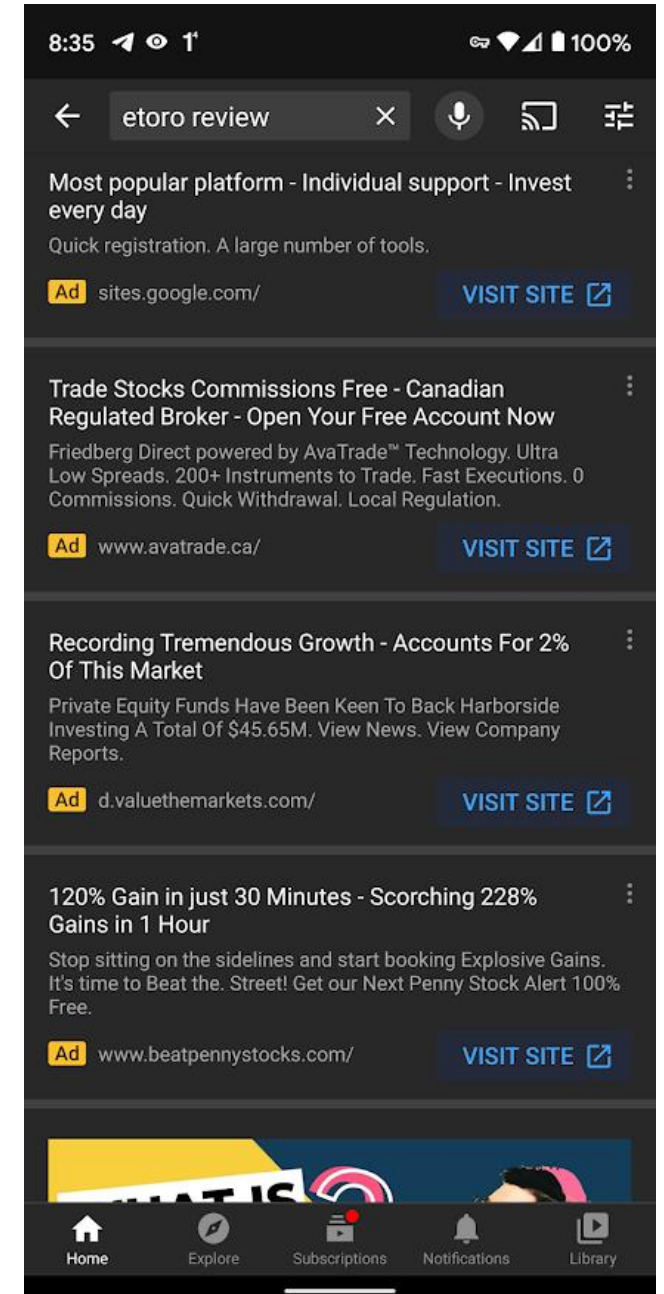

“ Maximizing Shareholder Value

This is new, Google ads used to be very small links next to your email.

It's not their fault, really,

they used to be **not evil!** [1]

[1] Google removed “don't be evil” from company's code of conduct in May 2018

What went wrong? (History)

the **architecture** of the first web:

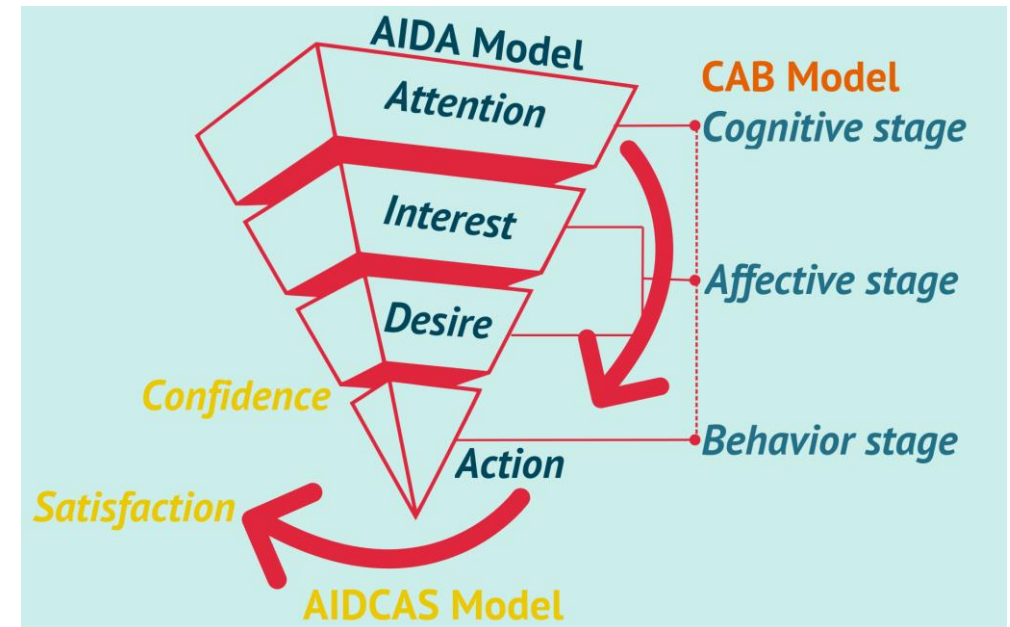

What went wrong? (History)

the **architecture** of the first web:

For **business model**,

what later became the Big Tech, decided to resort to techniques from the 19th century! [2]

What went wrong? (History)

By design, this has resulted in:

the Web becoming a bunch of monopolies,

TOP 100 WEBSITES

What went wrong? (History)

By design, this has resulted in:

the Web becoming a bunch of monopolies,

and us becoming sleepless goldfish!

TOP 100 WEBSITES

What went wrong? (History)

What makes the current Web centralized?

What went wrong? (History)

What makes the current Web centralized?

Server is where our data is kept

It's physically residing at Google, etc.

Emergence of evil is inevitable
when they have all our data

How to fix it?

For the architecture,

We can replace Star

With Mesh:

How to fix it?

That gives us Web 3.0,

aka the decentralized Web.

How to fix it?

That gives us Web 3.0,

aka the decentralized Web.

Instead of **attention**,
which is a key element in functional human beings,

we can consume something else to feed the beast!

How to fix it?

That gives us Web 3.0,

aka the decentralized Web.

Something like electricity!

We don't need to sacrifice people to generate more of it.

Solution

- Web 3.0 software stack has come a long way
- The movement started as decentralized money (Bitcoin)
- But quickly became decentralized **data structures**

Solution

- Web 3.0 software stack has come a long way
- The movement started as decentralized money (Bitcoin)
- But quickly became decentralized **data structures**

- The technology is here!
- The User Experience is not

Solution

The missing piece in the puzzle is not software, it's **Hardware!**

Evil won't perish until we take back control of our own data

Solution

- We can move the server to our homes, a “Personal Server”
- But we lose the Cloud! What if a fire destroys my server?
- Have another server at parents’? The data syncs up
- Still not enough guarantee, I should *never* lose my passwords!
- That data can still be secured in other places, e.g. with Filecoin
- So there will be monthly charges for a password manager?
- How about we let the server pay for all your apps, by doing computations?

Solution

This solution moves us from:

Architecture

Economics

Centralized

Attention based

Decentralized

Electricity based

User Experience

HW + SW

“box” is a new **form factor**
for Personal Servers

As a gadget, box has
three distinctive properties:

Stationary

Plug and Play

Composable

Stationary

Sits still at home next to the net connection

Compared to a smartphone, box's design doesn't need to keep tabs on:

- Battery consumption

- Pocketable size

- Safekeeping

Plug and Play

There's box the gadget, and box the server software

Any home computer can be converted to a box by installing the software

The gadget is designed for the non-tech-savvy consumers

It requires zero config for setting up, updates OTA

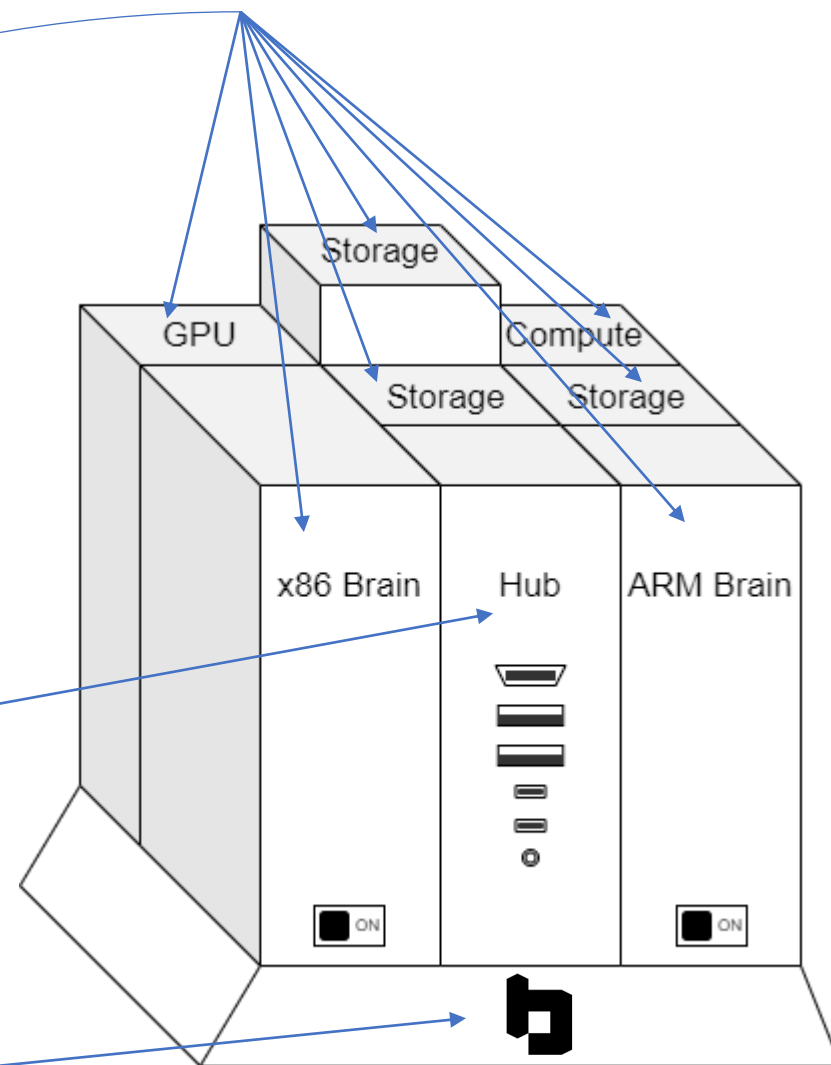

Composable

Consisting of up to 8 **nodes**

a **hub**

and a **base**

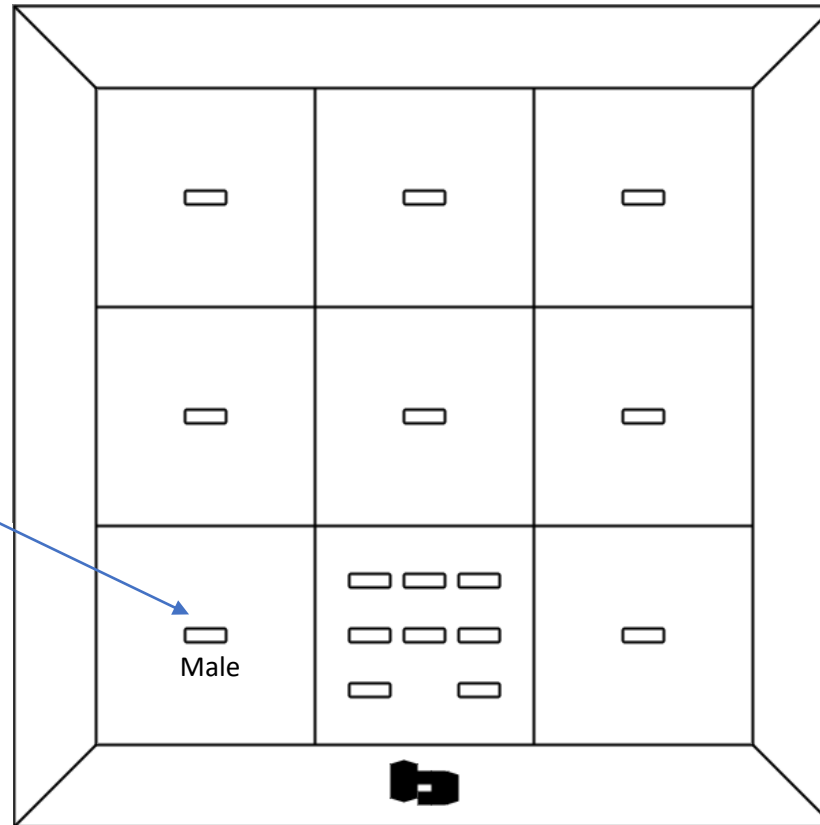

Composable

USB C Family connector

Base (top view)

Composable

Each box can be customized by the selection of nodes

One box can be configured for maximum data storage,
another can target coin mining by having multiple GPUs

Composable

“BoxOS” is a universal interface

Different boxes can talk over the network since they expose the same software interface

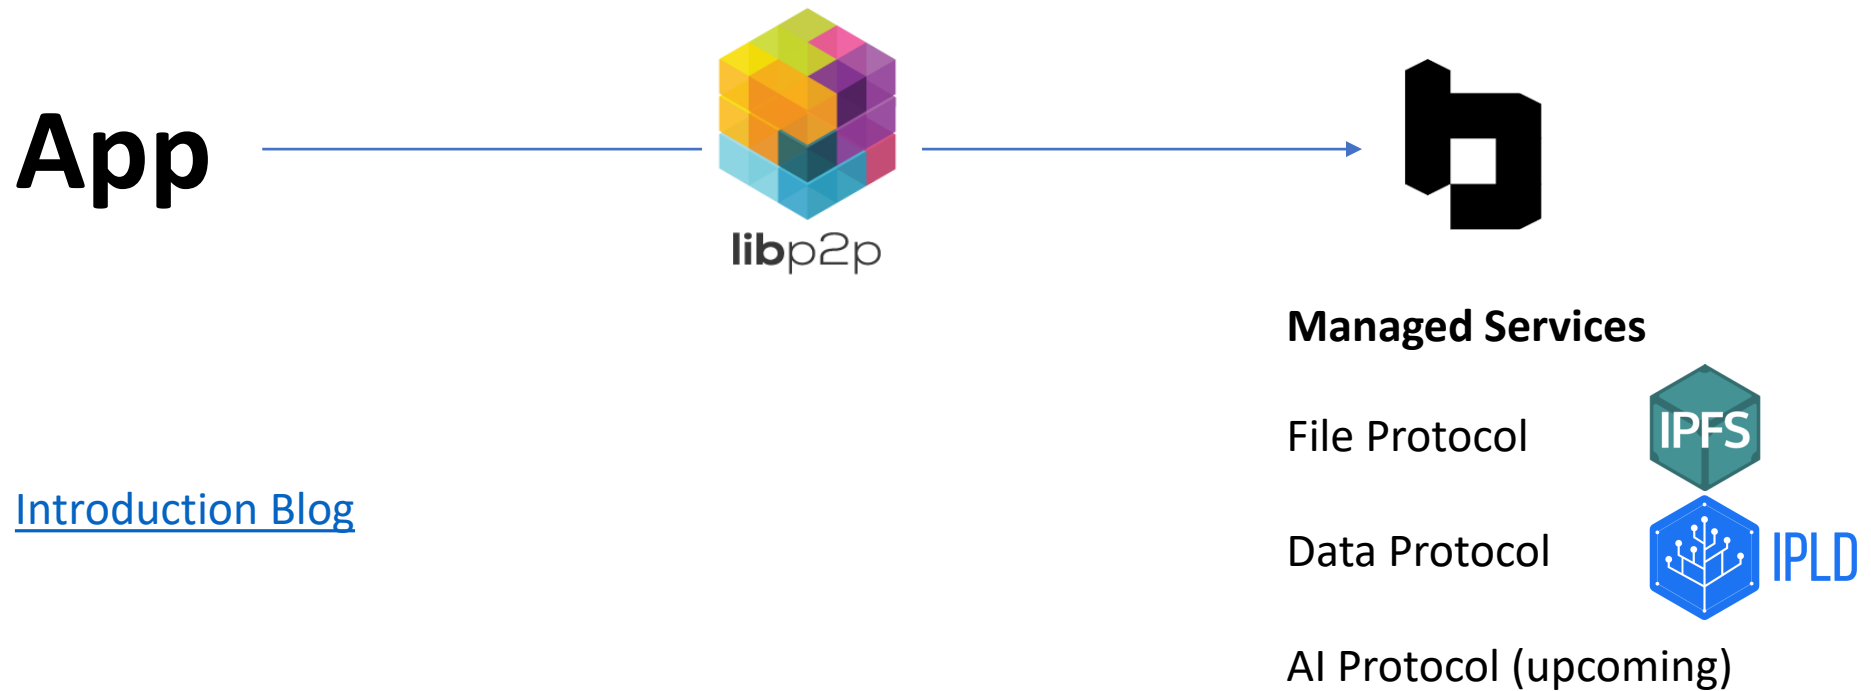

This distinguishes a box from traditional desktop workstations

BoxOS is not a standalone operating system

It's the server software running on top of a Linux (through Docker)

P2P Apps

A new generation of apps with distributed backends!

P2P Apps

Planned initial apps:

An alternative to Google and Apple photo services

A chat and social sharing platform

Unnamed
App Store

Medium of downloading and updating new apps
over blockchain, providing financial aid to OSS

Thanks for your attention!
